

My Affective Visualization

Envs 193DS

Spring/ May 28

Presented by

Tadeh Peroomian

At what time of day do I consume the most caffeinated beverages?

- I chose this question because I drink a lot of caffeinated beverages and was curious as to exactly how many I consume and at what time of day I consume the most.
- My predictor variable is the time of day (Morning, Afternoon, Evening), and my response variable is the number of drinks consumed.
- I usually drink coffee closer to when I wake up, so I predicted that Morning would have the most drinks consumed.

Other Variables

Time Woken Up

If I wake up later in the day, then my first caffeinated drink of the day would end up being later in the day.

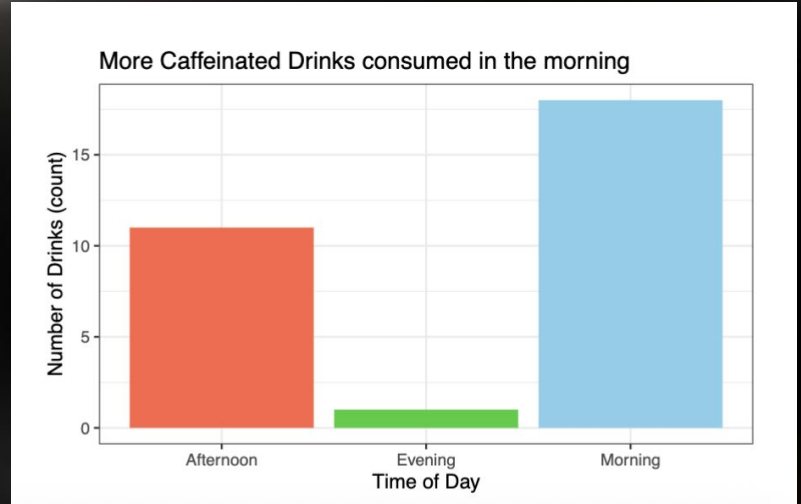

Amount of Water Consumed

The amount of water I drink in a day determines how thirsty I am and influences my desire to get a drink.

Drink Type

I wanted to see if the drink type would be different based on time of day.

My visualization from Homework 3

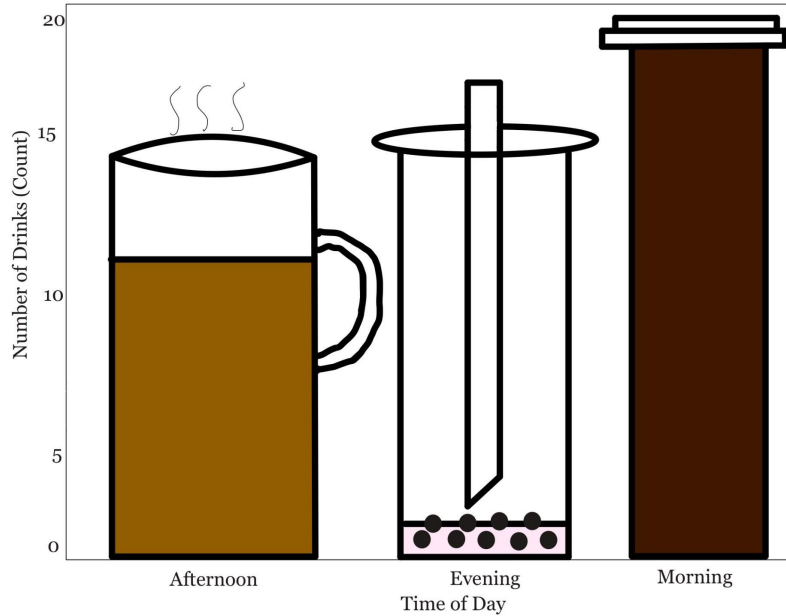

My Affective Visualization Idea

An idea I had for an affective visualization of my personal data would be to draw the bar graphs as coffee cups, with the cups filled up to the height of the bars.

I came up with this idea after looking through the examples given in the Homework Assignment

I will draw my affective visualization on my iPad.

More Caffeinated Drinks Consumed in the Morning

Artist Statement

I am showing the amount of drinks I consume at each time of day, represented by the amount of drink in each cup. I drew the draft on my iPad, using an art app.

I am trying to figure out how to incorporate the other variables.

Thank you
